ABSTPACT

Twenty-seven mildly and moderately mentally handicapped special education graduates from a special school and 23 mildly and moderately mentally handicapped special education graduates from a mainstream school were interviewed to determine long range benefits of each program. Interviews 1 and 2 years after graduation were designed to measure differences in employment skill levels, unemployment rates, job satisfaction, arrests and convictions, welfare assistance, financial independence, sincome level, and other variables. Data suggested that there was little difference in long range characteristics for either group, although the small sample size precluded drawing firm conclusions on either side of the question. ABSTRACT

Special Education graduates from a mainstream school (Lincoln) and from the special school (Pacific) were interviewed to determine whether graduates from either school exhibited greater long range benefits from their education program.

Interviews were designed to measure differences in employment skill levels, unemployment rates, job satisfaction, arrests and convictions, welfare assistance, financial independence, income level, and other variables.

Findings from this pilot study, though tentative, showed a slight but consistent trend toward more positive ratings for the Lincoln graduates.

Recommendations for the design of a proposed longitudinal study are included.

INTRODUCTION

Background Information

Special Education staff have invested a great deal of time and energy in programs based on the assumption that handicapped students will gain long range benefits by being located in regular school buildings rather than in separate facilities. The Pacific School is a separate facility housing Special Education programs for mentally and/or physically handicapped students who live within the Seattle School District.

Over the past two years there has been a substantial increase in the mildly and moderately mentally handicapped student population in "regular" school buildings, and a proportionate decrease in the population at Pacific. It seems important, therefore, to begin to gather some information on the post-high school circumstances of handicapped graduates in order to see if, in fact, there is any difference between those handicapped students who were graduated from a program located in a regular school and those from a program located in a separate facility.

Purpose of the Study. The question addressed by this study was: Do mildly and moderately mentally handicapped students graduating from a main stream Special Education program exhibit greater long range benefits from their education program than do comparable students graduating from a separate self-contained program?

METHODOLOGY

To answer the question of comparative long range benefits of mainstream vs. self-contained programs, Special Education graduates of one of the twelve regular Seattle High Schools (Lincoln) and a similar group of graduates of the Pacific School were interviewed, using the instrument described below. Four teaching members of the Special Education staff conducted the interviews during April, 1975. The interviewers met on one occasion with the writer after the interview format had been completed and before the interviews were begun. Agreements were made at that time for the purpose of achieving uniformity in conducting the interviews, and in drawing the sample.

Population and Sample. The population to which results of the study were to be generalized was the broad category of all mildly mentally handicapped students for whom an assignment to the special school or to a regular school would be feasible. The sample for this study consisted of 23 Pacific graduates who had been considered eligible for enrollment at regular high schools, and 27 Special Education alumni of Lincoln.

The extent of handicap experienced by some students at Pacific is severe enough to preclude enrollment in a regular school; students in this category were not included in the sample. Students were selected (from the 1973 and 1974 graduates of both Lincoln and Pacific schools) if, in the opinion of the Special Education staff, the students' abilities were such that they might equally well have been assigned to the other school. Thus, there was assurance that the two groups were similar.

<u>Instrument</u>. An interview format was developed which measured whether graduates from one school or the other exhibited more desirable outcomes in the following variables:

- 1) skill levels required in their employment
- 2) unemployment rates
- 3) job satisfaction
- 4) arrests and convictions
- 5) welfare assistance
- 6) difficulty in obtaining service from State Department of Social and Health Services
- 7) financial independence
- 8) income levels

3

- 9) problems with creditors
- 10) satisfaction with financial situation
- 11) rates of employment outside of sheltered workshop gituations
- 12); adequacy of preparation for employment.

A copy of the interview format appears in the Appendix, p. 11.

Limitations of the Study

The sample sizes (mainstream n = 27, special n = 23) were not large. Moreover, the ordinary assumptions about normality of underlying population parameters were not applicable. Consequently, statistical tests to discover significant differences between groups were not employed. Therefore, cohelusions drawn for the students attending either school could at best be tentative.

A further difficulty was the reliability of subject responses to sensitive questions relating to employment status, arrest records, and the like. Responses to questions posed in the study were accepted at face value. Some of the interviewers felt they had received inaccurate responses about personal income.

Handicapped students are placed in a mainstream school or the special school after careful consideration is given to the needs of the students and of each school's ability to satisfy those needs. In practice, this means that a student whose handicap requires it will be placed in the (special) Pacific School. The total student populations in the Special Education programs at the mainstream and regular schools are therefore not comparable, and this consideration was the basis for adopting the sampling strategy described above.

ANALYSIS

Characteristics of the Sample

The chief characteristics of the sample of 23 Pacific graduates and 27 Lincoln graduates are presented in Table I below.

Six respondents reported having any dependents, five of the six having graduated from the Lincoln school. Only one respondent reported ever having been arrested.

Interviewer Impressions

After the survey was completed, the Special Education teachers conducting the interviews felt a need to record their estimates of overall social adjustment, and overall community mobility. Additionally they felt that item 29 of the interview schedule, interviewer impressions of work category relating to job skills, should be supplemented with an additional impression of job potential. The distinction was made in order to appraise skills of those students who were actually employed, and to appraise the potential of all, even though some might not be employed.

A summary of these interviewer impressions is presented in Table II. Although the impressions were highly subjective, there was a slight but consistent trend toward more positive ratings for the Lincoln graduates.

CONCLUSIONS AND RECOMMENDATIONS FOR FURTHER STUDY

There was nothing found in the data to support the hypothesis that there is a difference in the early years following graduation from special schools or mainstream schools for handicapped students. The data suggest that there is little difference in employment and other long range characteristics for comparable graduates of special or mainstream schools. As noted earlier, however, the small sample size precluded drawing firm conclusions on either side of the question.

The basic question asked was significant and warrants further study. Of course, the question has significance only to students for whom "there is a choice," i.e., those students for whom it is feasible to place in either a regular or a mainstream school.

Important directions for future study are suggested by the experience of the staff in conducting the present pilot study. If such a longitudinal study is to be conducted, the following suggestions should be taken into consideration:

- Statistical comparisons should be made based on a comparatively large number of subjects.
- Accumulate data over a period of five or ten years in order to increase n.
- Involve Special Education staff in discussions to create the design.
- Develop a Better understanding among interviewers of the design requirements of the proposed study.
- Generate operational definitions of such terms as "skilled," "unskilled," or "high," "medium," and "low," when applied to such concepts as job satisfaction.
- Develop objective criteria for use in selecting the particil pants of the study.

APPENDIX

INTERVIEW SCHEDULE

·Pacific/Lincoln Post-Graduate Follow-Up

Before we begin the survey, let me tell you that the purpose of asking these questions is to find out from the graduates themselves just what the Seattle School District might do to improve its programs for many students. Other students will be better off, hopefully, because people like yourself have been willing to help in our survey. Still, if there are some questions you'd rather not answer, just tell me, and we'll leave them out. We learn how former students feel by counting the number of people who respond to questions. What you think is important to us, and we use the results by counting how people answer. Your name will not be used in the results, only the numbers from the counted answers. Do you have any questions before we start?

O.Kc? Then let's begin.
